GROW

# NFT HYDRO NUTRIENT MIXING INSTRUCTIONS

## 1. Nutrients

- Hydroponic 1Kg to 1000 litres of water.
- Solu-cal 650g to 1000 litres of water.

## 2. Mixing Instructions

- In general, we use 2 x 10L buckets to mix a concentrated mix keeping Hydroponic & Solu-cal separate! Important as when mixed together and left to stand sedimentation occurs.
- Empty the contents of the Hydrofood NPK packet (1Kg) into one bucket.
- Stir or shake well till fully dissolved (this becomes the concentrate mix).
- Fill one easy squeeze just makes it easier.
- Empty the contents of the Calcium Nitrate packet (650g) into the other bucket.
- Stir or shake well till fully dissolved (this becomes the concentrate mix).
- Fill the other easy squeeze.
- When topping up our NFT reticulation tank for the various crops using say a 10 liter bucket of water we add (from concentrate) 100ml Hydroponic & 100ml Solu-cal, provided the nutrient rich solution is moving little or no sedimentation occurs.
